Task 1: QA & Debug Report

By - Soumil Shamak

Application under test: Conduit (RealWorld) – Angular frontend demo

URL: https://demo.realworld.show

Test Date: Nov 09, 2026

Flows exercised: sign-up, sign-in, create/edit/delete article, settings, comments, favourites, feeds, logout, and validation edge cases.

Issues Summary

	Title	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1.	Deleting a post happens immediately, there's no "Are you sure?" step	Sign in -> open your article -> click Delete Article once.	**Expected**: confirmation before permanent delete. **Actual**: deleted immediately; redirected home.	High	Delete calls API with no confirmation modal/page.
2.	After a post is deleted, its old link opens a blank page instead of a clear message	Delete article -> revisit same /article/{slug} URL.	**Expected**: clear not-found message. **Actual**: header only, empty page body.	High	No UI for 404 errors /missing article response.
3.	"Your Feed" looks broken for new users nothing explains why it's empty	New user (no follows) -> Home -> Your Feed.	**Expected**: guidance/CTA. **Actual**: empty main area.	Medium	Empty list rendered without placeholder.
4.	The heart / "like" button does nothing when you're not signed in with no explanation	Log out -> click heart on any article on home.	**Expected**: login prompt or error. **Actual**: no feedback.	Medium	Unauthenticated favourite errors not surfaced.
5.	Topics typed as "qa, test" show up as one tag instead of two separate topics	New Article -> tags qa, test -> publish -> view article.	**Expected**: two tags. **Actual**: single tag qa, test.	Medium	Tag string not split/trimmed
6.	Like buttons only show a number, so they're hard to	Home feed -> inspect heart	**Expected**: e.g. "Favourite article".	Medium	Missing aria-label on favourite control.

	understand with accessibility tools	buttons (a11y tree).	**Actual**: name is only a number ("1").		
7.	When you edit a post, your existing tags don't appear in the form	Create article with tags -> Edit Article.	**Expected**: tags prefilled. **Actual**: Enter tags field empty.	Medium	Edit form not binding tagList to input.
8.	The app saves a profile photo link even when the link isn't valid photo breaks	Settings -> image URL "not-a-valid-url" -> Update.	**Expected**: validation. **Actual**: saved; broken avatar	Low	No URL validation on profile image.
9.	Red error messages stay visible even after you've filled in the missing fields	Publish empty article -> fill fields -> publish again.	**Expected**: errors clear when valid. **Actual**: errors remain until success.	Low	Error state not cleared on input change.
10.	On your own post, your name and Edit/Delete buttons appear twice on the same page	Open own article detail page.	**Expected**: one author/actions row. **Actual**: Edit/Delete duplicated.	Low	Duplicate template sections.

Root-cause analysis (Issue #1: Delete without confirmation)

On the article detail view, the Delete Article control is implemented as a destructive action button that immediately triggers the delete API call when clicked. There is no intermediate confirmation step - no modal, inline prompt, or browser confirm dialog - so a single mis-click or accidental double-click removes the article permanently. After a successful delete, the application navigates to the home feed, which confirms the backend operation completed but offers no undo window. From a product standpoint, users expect irreversible actions to require explicit confirmation; without it, support tickets and data-loss incidents are likely even in a demo environment. The likely root cause is that the UI component wires the button directly to the article service's delete method without a guard in the presentation layer. A practical fix is to add a confirmation modal with clear primary/secondary actions (Cancel vs Delete), disable the delete button while the request is in flight, and optionally show a brief success toast. The same pattern should be applied anywhere else destructive actions exist so behaviour stays consistent across the app.
